Electronic Voting Machine Information Sheet

Advanced Voting Solutions WINVote

Name / Model: WINVote¹

Vendor: Advanced Voting Solutions

Federally-Qualified Voter-Verified Paper Audit Trail Capability: None

Brief Description: The WINVOTE is a tablet-like touch-screen voting terminal equipped with a wireless local area network (LAN), a 15-inch full color screen with ZOOM capabilities, and built-in battery backup power, modem, and printer. When operational in a live election environment, the WINvote terminal rests in a plastic voting booth/secrecy and transportation case. It is designed as a stand-alone system to function both as a traditional precinct voting device and as a non-geographic voting station.

Detailed Voting Process: After checking in at the polling place, the voter will approach one of the terminals. An election official will activate the machine. The voter will touch the "Click Here to Start" button on the welcome screen, and the ballot-marking process will begin.

The screen will display one race at a time, with available choices listed below the race name. Write-in candidates can be selected by touching the "Write-In" button at the bottom of the choice list. After making a selection, touch the "Next" button on the bottom of the screen.

When all selection have been made, the voter will be taken to a summary screen that lists that name of each race and the option that was selected by the voter. If the voter wishes to change any of these races, he/she should simply touch the name of the race and make another selection. When the voter is satisfied with the summary screen, he/she should touch the red "Next" button on the bottom-right part of the screen. The next screen has a large red "VOTE" button. After touching that button, the ballot has been cast.

Electronic Voting Machine Information Sheet

Past Problems:

May 2005: Mississippi. Batteries failed early in the election, taking down the machines.²

November 2003: *Virginia*. The software failed (machines crashed throughout, voters reported difficulty in getting their choices to record), the hardware failed (some machines required new batteries, some needed to be "jiggled" back into operation, modems failed to transmit data). ³

November 2003: *Mississippi*. Voting computers at some polling places in District 29 failed to start up. Others overheated and broke down during the election, and not enough paper ballots were available to allow all voters to vote.⁴

NASED Qualification Status:5

06/17/02: Firmware 1.54
